

What do they THINK AND FEEL?

what really counts
major preoccupations
worries & aspirations

What do they SAY AND DO?

attitude in public
appearance
behavior towards others

Good
accuracy of
handwritten
digits

Poor quality of the
source document/
image due to
degradation over
time

Cursive
handwriting makes
separation and
recognition of
characters
challenging

Digit recognition
applications like
number plate
recognition, postal
mail sorting, bank
check processing

What do they SEE?

environment
friends
what the market offers

Competitors
nearby are
growing up

In future, different
architectures of CNN,
namely, hybrid CNN,
models, and domain-
specific recognition
systems, can be
investigated.

to achieve
network
recognition
accuracy and
comparable
accuracy.

Convolutional neural
networks (CNNs) are
very effective in
perceiving the
structure of
handwritten
characters/words

Breakthrough
performance
over the last
few years.

Questioning
the success
rate

does not
require
excessive
user input to
work

What do they HEAR?

what friends say
what boss say
what influencers say

Faster and
better
results

PAIN

fears
frustrations
obstacles

it is not done in
real time as a
person writes and
therefore not
appropriate for
immediate text
input.

sometimes,
characters look
very similar,
making it hard for a
computer to
recognise
accurately

no possibility of
obtaining
information
about the type
of the input

GAIN

"wants" / needs
measures of success
obstacles

not only produces a
classification of the
digit but also yields
information such as
the writing style

The system will show
characters that it was
not able to recognize
well or characters that
were not well trained.
The system will
recognize special
characters and digits

Provides various
applications of digit
recognition include
in postal mail
sorting, bank check
processing, form
data entry.
